Vadym Papusha

Python developer

□ Education

Lviv Polytechnic National University — Bachelor's Degree (Information Systems and Technologies)
2025 – Present

Languages & Frameworks:

Python, Django, FastAPI, Flask, HTML, CSS, Jinja3

Databases:

PostgreSQL, MySQL

Tools & Libraries:

Celery, Redis, Pydantic, Alembic, Docker, Git, SQLAlchemy

Other Experience:

PayPal API integration, WayForPay API integration, Web scraping (bs4), Nova-Post Api integration, AI model integration (Hugging Face, OpenAI API, OpenRouter)

Languages:

- English — **B2 (Upper-Intermediate)**
- Polish — **Basic**

Work experience:

Python Developer | Xedrum 

September 2025 – December 2025

Worked on **UniLogic**, a comprehensive platform for property management and logistics. My role involved designing backend components, improving system security, and building automated tools for market data processing.

- **Secure Password Recovery:** Built an automated "Forgot Password" flow using **FastAPI** and **SMTP**. Implemented backend logic for generating and validating short-lived, encrypted tokens via dedicated API endpoints.
- **Data & AI Pipeline:** Developed an automated tool using **BeautifulSoup4** to collect and clean data from various estate and logistics websites. I implemented logic to filter out "noise" (like ads, headers, empty tags etc.) and convert messy HTML into clean **Markdown**. This data was then integrated with the **OpenRouter API** to generate clear summaries for property objects and logistics reports
- **User Authentication:** Implemented **JWT-based** session management and **Pydantic** schemas for strict data validation, ensuring secure access and identity verification across all protected routes.
- **Collaboration & Workflow:** Used **Git** for version control and code reviews to maintain clean code. Coordinated with the frontend team via **Slack** to discuss API requirements and project tasks.

Pet projects:

[MoodShare](#) – full-stack social media platform with AI-powered content management, user interactions, and async background processing.

Key features:

- **AI Moderation:** Dual-layer post filtering – instant better_profanity library check, then advanced AI via **RabbitMQ**.
- **AI Summaries:** Post summarization processed asynchronously through RabbitMQ and **cached in Redis**.
- **User Interactions:** Comments, likes, and follows. Fully functional user-to-user chat powered by **WebSockets**. Integrated **Redis Pub/Sub** to ensure message synchronization and scalability across multiple server instances.
- **Authentication:** Secure **JWT-based login**.
- **External APIs:** Twitter/X integration with multi-language support.
- **Media & Async Processing:** Image uploads and efficient background tasks.
- **Performance:** Redis caching and database migrations for fast, reliable operation.

Tech Stack: FastAPI • React 18 • TypeScript • JWT • MySQL • SQLAlchemy • OpenRouter (Claude 3) • Twikit • Redis • Zustand • Tailwind CSS • Docker • pytest • RabbitMQ • Alembic

[BookingSite](#) is a modern web-based accommodation booking platform that allows users to browse available options, make reservations, leave reviews, process payments via PayPal, and receive real-time notifications about booking statuses through Telegram Bot.

Tech Stack: Django • HTML • CSS • Jinja3 • Celery • Redis • PostgreSQL • PayPal • Docker • aiogram
